

Λ missing mass: production-vertex beam momentum

Λ missing mass squared: production-vertex beam momentum

K18 RK beam-- Λ production closest approach

Reconstructed Λ production vertex (DST inclusive)

Reconstructed Λ production vertex (no LH2 cut, no M_x cut)

Reconstructed Λ production vertex (no LH2 cut, $M_X > 0.50 \text{ GeV}/c^2$)

$K^-\Lambda$ opening angle (lab)

Λ production angle in K^-p CM

Λ production angle in K^-p CM

Selected Λ production angle ($M_x > 0.50$, no LH2 cut)

Selected Λ production angle ($M_x > 0.50$, no LH2 cut)

Selected Λ production angle ($M_x > 0.50$, no LH2 cut)

Selected Λ : lab $\cos\theta$ vs lab momentum (no LH2 cut, all M_x)

Selected Λ : lab $\cos\theta$ vs lab momentum (no LH2 cut, $M_x \leq 0.50 \text{ GeV}/c^2$)

Selected Λ : lab $\cos\theta$ vs lab momentum (no LH2 cut, $M_x > 0.50 \text{ GeV}/c^2$)

Selected Λ invariant mass (production vertex, no LH2 cut)

Selected Λ invariant mass (production vertex, no LH2 cut, $M_x > 0.50$)

Trigger acceptance for generated $\Lambda\eta$

Selected Λ production angle, trigger-acceptance corrected ($M_X > 0.50$, no LH2 cut)

Selected $\Lambda\eta$ yield vs production-vertex K18 beam momentum ($M_x > 0.50$, no LH2 cut)

Expected $\Lambda\eta$ yield for all E72Physics runs (K-Beam scaled)

$p_K^{\text{prod}}=772\text{--}776\text{ MeV/c}$

$p_K^{\text{prod}}=776\text{--}780\text{ MeV/c}$

$p_K^{\text{prod}}=780\text{--}784\text{ MeV/c}$

$p_K^{\text{prod}}=784\text{--}788\text{ MeV/c}$

$p_K^{\text{prod}}=788\text{--}792\text{ MeV/c}$

$p_K^{\text{prod}}=792\text{--}796\text{ MeV/c}$

$p_K^{\text{prod}}=796\text{--}800\text{ MeV/c}$
